Large Docket Tree	2
Known Issues.....	2

Release Summary

The FDMS version 4.5.1 release was intended as a patch release to address a few items that were identified during the later testing period prior to the release and through Help Desk requests immediately following the FDMS 4.5 release. The primary changes to FDMS 4 for this release include the following:

- Deduplication
- Favorites
- Google Analytics
- Large Docket Tree

Deduplication

The loading icon remained on the screen when users attempted to view Deduplication results for some Federal Register Documents. The team improved the query and performance is significantly improved.

Favorites

During final release testing, it was discovered that if a user adds a Docket/Document to My Favorites, the Docket/Document will be removed from the My Favorites list designated by another user. The issue has been resolved and multiple users can mark the same Docket or Document as a Favorite.

The Docket/Document Favorites that users had designated in the FDMS 3 environment were appended to the bottom of the Docket/Document Favorites lists designated in the FDMS 4 environment. This was a one-time migration and was completed for all users with Dockets/Documents listed as Favorites.

*Please note: Any Documents with a TEMP ID were excluded from the migration as TEMP Documents do not appear in FDMS 4.

Google Analytics

Moved Google Analytics tracker to configuration properties files for all environments, so that no code change is needed on future builds.

Large Docket Tree

The Help Desk received a report from an FDMS user that the Status' drop down was blank during Batch Processing for 2 or more items from the Large Docket Tree. The issue has been resolved and users will now see the appropriate status options for Batch Processing within the Large Docket Tree.

Known Issues

None noted.
